

# SHARKVAC XL – WALL CLIMBING FEATURE

- Float position "I" is the default position locating the float in the middle of the cleaner. Provides the best cleaning behavior for most swimming pools.

- Float position "II" will provide and additional angle in the movement where the cleaner will travel along the water line or pool wall faster. Better cleaning coverage

- Float position "III" provides a reduced angle in the movement. Cleaner will spend more time scrubbing the pool wall along the water line. This position also aids wall climbing in pools with slick surfaces such as tile and fibreglass.
